

LinkedIn Advertising Performance Report

*Campaign Insights &
Performance Analysis*

Executive Summary

- This report presents an analysis of recent LinkedIn advertising campaigns, focusing on the performance of sponsored content compared to organic distribution.
- The presentation evaluates key performance indicators such as reach, impressions, engagement, click activity, and audience responsiveness to assess the effectiveness of the campaigns.
- The analysis aims to identify performance trends, measure the impact of paid amplification, and uncover insights that can support future content strategy, audience targeting, and advertising decisions.

Performance Analysis

General Overview

Total Impressions

Total Impressions
2.23K

Total Impressions
15.6K

Sponsored distribution delivered over 7x higher impressions than organic, confirming that paid amplification is highly effective for scaling content reach.

Total Clicks

Total Clicks
397

Total Clicks
573

Despite significantly higher impressions, sponsored content only delivered a moderate increase in clicks, indicating that reach scaled faster than actual user intent or engagement.

Total Reactions

Total Reactions
53

Total Reactions
14

Organic distribution consistently elicited more expressive user feedback, suggesting stronger content resonance within naturally engaged audiences.

Average Engagement Rate

Average Engagement Rate
14%

Average Engagement Rate
7.83%

Organic content achieved a higher overall reaction rate, indicating stronger audience responsiveness and content resonance in non-paid distribution.

Clicks

Organic vs Sponsored

- Sponsored promotion increased clicks significantly for PO1, PO3, and PO4
- PO4 recorded the highest click volume across both organic and sponsored performance
- PO2 and PO5 experienced lower click performance after sponsorship compared to their organic versions
- Click performance across sponsored posts was inconsistent, indicating varying audience response to boosted content

Engagement Rate

Organic vs Sponsored

- Organic engagement rates were consistently higher than sponsored across most posts
- PO4 recorded the highest engagement in both organic and sponsored versions
- Sponsored engagement dropped significantly for PO2 and PO5 compared to their organic performance

Reactions

Organic vs Sponsored

- Organic posts consistently generated higher reactions than sponsored posts across all content (PO1–PO5)
- PO4 recorded the highest reaction volume in both organic and sponsored formats
- Sponsored reactions remained very low across all posts, with no post exceeding 4 reactions
- The gap between organic and sponsored reactions is significant across every post

Reactions (Organic)

Reactions (Sponsored)

Impressions

Organic vs Sponsored

Impressions (Organic)

Impressions (Sponsored)

- Sponsored posts generated significantly higher impressions than organic across all content
- PO4, PO3, and PO5 recorded the highest impression volumes under sponsored distribution
- Organic impressions remained relatively low and varied across posts, with PO2 being the highest
- Impression growth is consistent and substantial across all posts when boosted

Carousel vs Video

Organic vs Sponsored

Carousel content outperformed video content in both clicks and engagement across organic and sponsored distribution

Organic carousel posts recorded exceptionally high engagement efficiency compared to sponsored carousel posts

Sponsored video content generated very low engagement despite paid amplification

Insights

- Sponsored campaigns increased click volume, but performance varied significantly across posts, indicating that audience response is strongly influenced by content quality and relevance.
- Organic content consistently achieved stronger engagement efficiency, suggesting that naturally reached audiences were more responsive and connected to the content.
- Lower reaction levels on sponsored posts indicate that paid reach expanded visibility more effectively than emotional or expressive audience interaction.
- Sponsored distribution proved highly effective for scaling content visibility, making impressions the strongest performing metric within paid campaigns
- Carousel content consistently outperformed video content in both clicks and engagement, indicating stronger audience interaction with swipe-based and multi-frame formats.

Recommendations

- Since sponsored posts performed strongest in impressions, future paid campaigns should focus on maximising brand exposure and audience reach
- Carousel posts consistently outperformed video content in clicks and engagement, making them the most effective format for audience interaction
- Posts that perform well organically are more likely to sustain stronger engagement when amplified through paid promotion
- The drop in engagement and reactions across sponsored posts suggests the current paid audience may be too broad or insufficiently aligned with the content
- Future paid posts should include stronger hooks, clearer messaging, and more compelling calls-to-action to convert visibility into meaningful interaction
